

Instalar el servidor de dominio

Hacerlo en la máquina del dominio. Esté paso se sugiere hacerlo luego de tener las 4 máquinas virtuales (no es necesario tener los 4 para empezar con esto).

Idealmente configurar la ip de la tarjeta que se está utilizando, en este caso se usó la tarjeta NAT.

Nota: importante que en las máquinas en donde se deben instalar SQL Server y Sql Management no instalar nada hasta unirlo al dominio, es sumamente importante hacer caso a esto, de lo contrario van a surgir errores con sql.

En la imagen anterior es necesario darle click en crear nueva regla de entrada.

Está sigue siendo la máquina del dominio

Configurar:

Preferible darle click en reiniciar en caso sea necesario

Colocarle un nombre, es importante que esté nombre se recuerde uno, va ser el nombre del dominio, en este caso: “galileo” solo está parte se usará en otro paso.

En el paso anterior no seleccionar nada.

Aquí colocar “GALILEO”

No se toca nada de esto.

Ahora, ya está instalado.

Ahora ir a:

El nombre “SERVIDORDOMINIO” es el nombre de mi máquina que le puse en Windows.

Es importante darle click en crear nueva zona.

Esté paso es muy importante, aquí se debe de poner “galileo”, debido que en los pasos previos en el nombre de mi dominio coloque “galileo.com”. Aquí se coloca solo “galileo”

Ahora se puede observar que creo la carpeta “galileo”
